REGISTRATION REPORT.
ONTARIO
1894.

REPORT

RELATING TO THE REGISTRATION OF

BIRTHS, MARRIAGES AND DEATHS

IN THE

PROVINCE OF ONTARIO

FOR THE

YEAR ENDING 31st DECEMBER,

1894.

PRINTED BY ORDER OF THE LEGISLATIVE ASSEMBLY

TORONTO:

WARWICK BROS. & RUTTER, PRINTERS, 68 AND 70 FRONT ST. WEST.
1896.

OFFICE OF THE REGISTRAR-GENERAL FOR ONTARIO,
TORONTO, January 1st, 1896.

*To the Honorable George Airey Kirkpatrick, LL.D., Q.C.,
Lieutenant-Governor of the Province of Ontario.*

MAY IT PLEASE YOUR HONOR:

In compliance with the Statute in that behalf, the undersigned respectfully presents to Your Honor the Annual Report of Births, Marriages and Deaths for the year ending 31st December, 1894.

Respectfully submitted,

R. HARCOURT,

Registrar-General.

OFFICE OF THE REGISTRAR-GENERAL,

December 3rd, 1895.

TO THE HON. RICHARD HARCOURT,

Registrar-General of the Province of Ontario.

SIR,—I have the honor to submit for your approval the report respecting births, marriages and deaths, registered in Ontario during the year 1894.

Population.

The population for the year 1894, which has been adopted as the basis for the calculations contained in this report, is 2,189,116 being an increase by births over deaths of that for 1893, of 21,656. This means a percentage increase of practically one per cent. during the year, and this rate has been adopted in the various tables.

Births.

The total births recorded in 1894, was 42,051, being a total increase of 843 for the whole Province. As will be seen in Table I. the decreases are, as seen below. In the 13 cities with a total population of 425,163, there was a decrease of 480 births, while in the rest of the Province, with a population of 1,763,953, there was a decrease of 363.

This means a total decrease of rather more than one in the 1,000, in the year, or .52 per cent. If, however, the natural increase of population in cities for 1894 is calculated, we find that the decrease in births amounts to 1.4 per 1,000. In the rest of the Province the decrease was but slightly more than .2 in the 1,000. The ratio of decrease of the cities, as compared with the rest of the Province, was as 1.4 to .2 per cent., when the increase of population is taken into account. The variation in the distribution of this decrease in the several cities is interesting.

The greatest decrease was that in Ottawa, where as before observed, the fluctuations have always been greatest. Kingston with 120, stands next in the rate of decreases; Hamilton has decreased 81; Windsor has a decrease of 47, and Toronto an increase of 48.

The total birth rate for cities, 20.3 per 1,000 in 1894, falls below that in any year in the last decade, as seen in the following table:—

Table of Births in Cities of Ontario per 1,000, from 1885 to 1894.

1885.....	28.2.	1890.....	27.4.
1886.....	27.1.	1891.....	23.4.
1887.....	27.5.	1892.....	20.8.
1888.....	27.0.	1893.....	21.7.
1889.....	29.3.	1894.....	20.3.

With a steady decennial decrease of births in the Province as a whole, most marked in the cities, it will be of interest to make a comparison with the birth-rates of other countries, in order that we may see whether such a condition exists elsewhere, and if so, to enquire wherein lie the causes of such a phenomenon.

Births according to decennial census, 1860=38.15 per 1,000.

Table of Births in certain Countries with Ratio per 1,000 of Population.

England and Wales.			
1883	33.5	1889	31.1
1884	33.6	1890	30.2
1885	32.9	1891	31.4

1883	25.17	1889	26.19
1884	25.45	1890	25.81
1885	25.12	1891
1886	25.37	1892
1887	25.80		
Ontario.			
1884	23.1	1890	22.0
1885	23.5	1891	21.1
1886	22.0	1892	19.7
1887	21.7	1893	19.8
1888	21.8	1894	19.2
1889	22.6		

What is at once apparent in these tables, is that the birth-rate in every country of Europe and America, where a system of vital statistics has been established, has seen a decline more or less marked in each, but nowhere more marked perhaps, than in Ontario. Assuming, as necessary, in our remarks, the registration in recent years, to be at least as complete as ten years ago, it is apparent that some cause or causes are operant to produce a decline of births so serious, in a still sparsely settled Province, as to call for the attention of all interested in the moral, social and economic welfare of the people.

In a careful study of the decline in births in the United States, in the March number 1895, of the journal of the American Statistical Association, the article reviews the study of Miss Brownell, on the *Significance of a Decreasing Birth-rate*.

Amongst the sociological questions brought under discussion are inequalities of production and consumption, voluntary prevention of conception, etc., due, or to a certain extent caused, by increasing civilization. This latter is considered the direct cause of the decrease in birth rates by Hansen, Longstaff, Fothergill, Billings, Edson and others.

With regard to the second class of facts, referred to by Miss Brownell, viz.: That regarding the increased prevalence of nervous diseases, as illustrated by death statistics,—it is proper to say that the same tendency of such to increase, seems present in Ontario as in the United States. This is probably true, although, with the more general care and increase of inmates of lunatic asylums, together with the more accurate definition of disease in recent years, it cannot be doubted that a number of diseases are now classified as nervous, which before were placed under other headings.

Assuming, however, that there is an undoubted increase of this class of diseases, it may be well to point out that urban conditions, where the wear and tear of life is increased, where competition becomes more severe, where society grows artificial in the degree of its complexity, must necessarily create a draft upon the nervous energy, which undoubtedly tends to a lessening of those functions, upon which procreation so intimately depends.

If then, as has been pointed out in a previous report, the tendency to urbanization has gone on in Ontario as in other older settled parts of the continent, we must conclude that similar effects as seen elsewhere must attend such movements of population.

What this urbanizing tendency means is seen in the following table :

Table of Increase of Cities in United States and Canada.

New York, 1880-1890.....	25 per cent.
Brooklyn, ".....	40 "
Chicago, 550,000-1,100,000.....	110 "
Ontario cities between 1880-1890.....	49 "

That the process is not confined to this continent is seen in the growth of London, and other continental cities.

London had a population of 3,311,298 in 1871.
" " 4,776,661 in 1881.
" " 5,633,808 in 1891.

As long ago as 1872, the Registrar-General of England made the following statement : "The great cities of the world are every year growing greater. Vienna and Berlin, have increased rapidly. Paris for reasons too obvious and deplorable, has remained nearly stationary since the war, but the population amounted at the last census to 1,851,792 and the capital of France is, after violation by a mob, in the face of her enemies, and of her own citizens still the Queen of continental cities. Rome is no longer a city of ruins, for poets to sigh over, but the living capital of the Italian nations, in sisterly union with Florence, Naples, Turin, Milan and Venice. In no land, however, are the cities greater than in the English Empire. The cities of India are flourishing. The United States are emulating the land of their origin ; but England maintains its ascendancy and her capital is the greatest the world ever saw. Babylon, Thebes, Rome, were never so populous as London, which has now, within its widest boundary, upwards of four million souls ; and has in the middle of 1872, within the limits of the weekly tables, 3,311,298."

In a recent article by Dr. Mott, of Edinburgh, the author endeavors to show that, "the outcome of the modern intellectual development in the production of great social changes, is to produce a widespread physiological dissolution, namely, a lowering of the vitality of the individual."

As a result of civilization, the rich, he tells us, get too much, the poor, too little ; people moreover, tend to accumulate in unhealthy towns, to suffer from alcoholism, syphilis, over-pressure of business, etc. A further evil, he believes, results from the fact that artificial selection, is "replacing natural selection," and that medical science preserves degenerate types. Such is but one side of the case. As Dr. H. Campbell, in "The Causation of Disease," remarks, "Imperfect and inferior types are, as I have shown, being perpetually weeded out." In regard to the environment of such, as regards occupation, it must in its very nature, in some instances, be fatal to the development of the individual race. Such is especially true in some large manufacturing cities, where large sections of the population are engaged in indoor occupations, such as woollen manufactures. As Campbell, remarks, "Residence in Central London, rapidly tends to deterioration and family extinction." Mr. Cantlie has been unable to find an individual whose ancestors, from the grandparents downwards, were born and bred in London. The following two cases are the nearest approach to such an ancestry : The first, is that of a man with a Somerset grandfather, whose folks have lived in London, commencing from the grandparents. Height, 5 feet 1 inch ; age, 21 ; chest measurement, 28 inches. His head

measured round above the eyebrows 19 inches, (nearly three inches below the average) ; measured across from tip of ear to tip of ear 11 inches, ($1\frac{1}{2}$ inches below average). His aspect is pale, waxy ; he is very narrow between the eyes, and with a decided squint ; solemnity intense. If such be the saddest and extreme side of the question, there is yet another already referred to. Not only must the environment of the child after birth, in its influence be fully appreciated, but even more in its ante-partem environment. We must recognize the most important principle, in the evolution of the individual, viz : "*That the influence of environment is great in proportion as it acts early in the life-history of the individual*"

The truth of this principle has again and again been illustrated by scientists and even in a popular way by the public—both by observation and experiment. But in the question of the bearing of the principle on the matter under consideration, it is plain that whatever influence, whether external or internal, which directs the energy of the nerve centres from those more purely animal and physiological functions of the body, must rob such relatively of their normal energy.

In the bearing, therefore, of this influence on the lowering birth-rate in cities, where, speaking generally, the more acute intellects are found, the statistical results of the studies of Francis Galton in his "*Men of Science*" may be quoted.

Writing in 1874 regarding the evolution of celebrated scientists, he says regarding "*Fertility* :—

"The families are usually large to which scientific men belong. I have two sets of returns, the one of brothers and sisters, excluding for the most part those who died in infancy ; and the other of brothers and sisters who attained thirty years. In these several cases I have indeed the scientific man himself, and find, on an average of about 100 cases, that the total number of brothers and sisters is 6.30 in the first case, and 4.80 in the second. It is a matter of great interest to compare with these figures the numbers of the children of the scientific men themselves. It is an easy thing to do so with farmers, because the time of marriage proves to be nearly the same in both cases ; if anything, the scientific men marry earlier than their parents.

It remains to eliminate all cases of absolutely sterile marriages on the part of the scientific men, and those in which there might yet be other children born—I find the number of their living children (say of ages between 5 and 50) to be 4.7. This implies a diminution of fertility as compared with that of their own parents and confirms the common belief in the tendency to an extinction of the families of men who work hard with the brain. On the other hand, I shall show that the health and energy of the scientific men are remarkably high ; it therefore seems strange that there should be a falling off in their offspring. I have tried in many ways to find characteristics common to those scientific men whose families were the smallest, but have only lighted on one general result, which I give provisionally, namely, that a relative deficiency of health and energy, in respect to that of their own parents, is very common among them. Their absolute health and energy may be high, far exceeding those of people generally, but in respect of a notable falling off from the yet more robust constitution of the previous generation, it is this which appears dangerous to the continuance of the race. Many figures give the remarkable result that there are no children at all in one out of every three of these cases. I think that ordinary observation corroborates this conclusion, and that those of my readers who happen to have mixed much in what is called intellectual society will be able to recall numerous instances of persons of both sexes, but especially of women, possessed of high gifts of every kind, including health and energy, but of less solid vigor than their parents, and who have no children. I do not overlook the fact that the scientific men are an urban population, being mindful of results I have published elsewhere, which show a similar diminution in the average fertility of townsmen as compared with country folk ; but this would not account for their being less prolific than their parents who were also townsmen, or for the large number of wholly sterile marriages."

We have thus had set forth the two elements, in both the lower and higher classes of urban populations, which seem to tend directly to the reduction of the birth rate, and which, were it not for that enormous influx of some of the most vigorous and energetic of the rural population, would tend to reduce this urban birth-rate by a still greater rate.

Remembering, however, the fact, as set forth in the report for 1893, that in Ontario there had been, in the census years 1881-1891, an absolute loss of rural population in the province of 62,427 or 1.5 per cent., or a loss of 12.6 per cent. between the actual and calculated natural increase, while the increase in the cities amounted to 126,326, or 49 per cent., or 38 per cent. more than the calculated natural increase, it is manifest that in these two natural and apparently inevitable results, we have operating two forces of the most serious import to the progressive development of a native race, indigenous to the soil, in harmony with the spirit of its institutions and ambitious for the development of a people, proud of its traditions, and rejoicing in the hopes of a glorious future as a nationality. With a population of only thirty to the square mile of the rural population, in the older cultivated counties it is manifest that any question of "the struggle for existence," or the survival of the fittest, ought not yet to be heard of in Ontario, even in undertones, as an excuse for propounding the reasonableness of the doctrine of Malthus. Have we any reason for believing that in Ontario the operation of its principles has played, or is playing, any practical part in the depression of the birth-rate in a young and still vigorous community to a total of 19.8 in the thousand, and of only 20.3 in our 13 cities? In the study by Miss Brownell, showing the relation between a falling birth-rate and the increase of nervous diseases in American States, she has evidently overlooked the fact that with urban conditions quite as complex in England and continental Europe, the birth-rate in Germany in 1892 was 35.7, and in England was 30.5 per 1,000. That the decline in England was nearly normal is seen in the fact that the marriage rate in 1892 was 7.7, as compared with the average of 8.05 for 55 years. This normal relation is equally well seen in Ireland, where its birth-rate of 22.95 is associated with the fact of a marriage rate as low as 4.4 per 1,000. While nervous diseases have undoubtedly increased in England, it is quite apparent that the influence has not yet been of the extreme kind indicated in the comparisons drawn from the last American census. The contrast is yet more marked, when the rising marriage rate in several of the Eastern States is remembered. Thus after deducting divorces from the marriage rate we have in New Hampshire a marriage rate of 8.16 and yet the birth-rate has declined to 19.1 per 1,000. The most notable phenomenon in this connection is in the fact of New Hampshire having in 1892 divorces to the extent of 8.5 per cent. of the total marriages.

The difficulty of such an explanation for the falling birth-rate as that given by Miss Brownell is increased, when the following figures for the Michigan Statistical Report for 1892 are given :

There were in Michigan, according to the census of 1890, 685,424 persons of native birth between 15 and 45 years of age, and 314,323 persons of the same ages of foreign birth. There were 18,368 children born to native couples, or 26.8 per 1,000, and 18,344 to foreign parents, or 58.4 per 1,000. These latter figures are undoubtedly too high, but they establish the existence of facts, hardly explainable on a basis of deaths from nervous diseases of every class, amounting to but one per 1,000.

In Ontario we find that under the two headings, apoplexy and paralysis, which include most of the nervous diseases affecting adults, the deaths were, in 1893, but 1 in 23 deaths, or .58 per 1,000 of population.

In order to in some degree discover the actual birth-rate in Ontario from a given number of marriages, an abstract has been made, as seen in the following figures, of the marriages which took place in Toronto in 1892, and the births resulting therefrom up to the end of 1893 :

Total marriages celebrated in Toronto in 1892.....	1,609
Total marriages celebrated of persons resident in Toronto	1,140
The marriage rate according to calculated population of Toronto by natural increase	5.8 per 1,000
Total marriages in 1892 of non-residents (25 per cent.).....	469
Total births to end of 1893 from marriages of persons resident in Toronto....	361
Average age of females married in Toronto in 1892.....	24.06 years.
Average age of females married in Toronto, non-resident, in 1892.....	23.83 "

The following table shows the distribution of the 1,140 marriages celebrated in Toronto in 1892, and the number of children born therefrom and registered up to the end of 1893 :

Number of Marriages and Births by Age Periods of Females in Toronto.

MARRIAGES.

Age periods.	15-20	Per cent. of whole.	20-25.	Per cent. of whole.	25-30.	Per cent. of whole.	30-35.	Per cent. of whole.	35-40.	Per cent. of whole.	40-45	Per cent. of whole.
Totals	115	12.7	571	50	281	24.6	86	7.5	37	2.9	20	1.7

BIRTHS.

Age periods.	15-20.	Per cent. of whole	20-25.	Per cent. of whole.	25-30.	Per cent. of whole.	30-35.	Per cent. of whole.	35-40.	Per cent. of whole.	40-45.	Per cent. of whole.
Totals	49	13.5	193	53.4	93	25.7	17	4.7	6	1.6

These figures are of much interest and importance and supply much valuable information. They show that in the first three quinquennial periods of productive female life 87.3 per cent. of all marriages took place, leaving only 12.1 per cent. for the remaining 15 years. They further show that of the total births 92.67 per cent. took place in the first 15 year period and but 6.3 per cent. in the second. They likewise show that relatively the three year periods 15-20, 20-25, 25-30, have a greater percentage of births by 0.8 per cent., 3.4 per cent. and 1.17 per cent., compared with the total births, than the marriages for these periods compared with the total marriages.

It is further interesting to note the fact that the fertility of marriages in the first three five year periods is almost equal, they being 15-20 years, 33.7 per cent. ; 20-25, 33.8 per cent., and 25-30, 33 per cent. At later age periods the ratio of births to marriages decreases very rapidly, it being for 30-35, 19.9 per cent., and 35-40, 16.2 per cent., no births being recorded for marriages of females over 40 years.

Some interesting comparisons may be made between these figures and those of England and other countries. Dr. Farr, Registrar-General of England, in his census report of 1871, stated that 8 out of every 10 brides and bridegrooms at their first marriage are between 20 and 30 years of age, their mean age being 25, that of the bridegroom 25.65 and of the bride 24.3 years. It will be seen that, counting all marriages in Toronto, almost exactly 75 per cent. of the females were between 20 and 30 years of age, a rate slightly below that in England. This is due to the fact that the average age at marriage is somewhat lower than in England, being 23.83 years. In other words it would seem that rather more persons were married in Ontario between the ages of 15-20 than in England. But according to the Registrar-General's Report (England) rather more than 20 per cent. of all marriages in the years between 1866-1886, were under 21 years. As, however, in these tables age 20 is added to the second period, we find that if this is added to those under 20 it makes a percentage of 22.3 of the whole married before 21 years. In England the number of minors marrying prior to 1866 declined to 13.3 per cent. in 1841.

Diagram of Marriages in Ontario from 1884-1894, showing the mean, and the increase or decrease for each year.

Diagram of Births in Ontario from 1884-1894, showing the mean, and the increase or decrease for each year.

It is apparent then from these several comparisons of ages that in no way can the female population, owing to age at marriage, be considered less fecund than in England. Dr. Farr (England) states that nearly half the children born in England are of parents under 30 years of age. According to Toronto statistics 335 out of 361 children, or 92.8 per cent. born, were from mothers under 30 years of age. Dr. Newsholme, referring to English statistics, states that if no woman married before 30 the births would be reduced to two-thirds of their present number, and if the marriage age were postponed to 35 the births would fall to one-third of their present number. Fortunately the great bulk of marriages of women in Toronto takes place before 30 years, otherwise the child population would rapidly disappear, since while the marriages after 30 were 12.1 per cent. of the whole marriages, the births were only 6.3 per cent. of the whole births.*

Taking the figures we have studied it seems apparent that if we take the proportion of births to marriages in the 30 to 35 year and subsequent periods, the fecundity of the females is distinctly lower in Toronto than in England. It has been shown also that the marriage rate for the Province as a whole is distinctly lower; and applying suggested corrections for imperfect returns can in no way explain the fact that of 143 marriages between 30 to 45 years only 23 births are recorded, or 2.4 per cent. for each year of the fifteen.

Assuming that the distribution of the population of Ontario during the several age periods approximates that in Massachusetts in 1885, we will see by the following table that inasmuch as the population between the ages of 15-45 is relatively higher than in England, owing to the lower mortality during the early age periods, that there should be not only more marriages but also more births in a city such as Toronto.

Thus we have, according to the tables of Dr. Newsholme for England and Dr. Abbott for Massachusetts, the following number of persons living in England and Massachusetts, at the several age periods per 1,000,000 inhabitants :

Age periods.	England.	Massachusetts.
15-20	100,000	110,000
20-25	91,000	101,000
25-30	81,000	96,000
30-35	70,000	76,000
35-40	62,000	70,000
40-45	55,000	61,000

From every standpoint, therefore, from which we examine the marriage and birth returns of the population of Toronto there seems to be but one conclusion which is that the marriage rate is for such a population abnormally low and that the birth-rate in relation to those marriages which take place is proportionately still lower.

* M. Joseph Korosi states that of every 100 marriages in Buda-pest in the several age periods, the fertility is as follows : 15-20, 35 per cent. ; 20-25, 32 per cent. ; 30-35, 24 per cent. ; 35-40, 17 per cent., and at 40 years scarcely 7 per cent.

Marriages.

The total number of marriages recorded in Ontario in 1894, as seen in tables 12 and 13 of the report, was 14,341, or 28,682 persons. This is a rate of 6.5 per 1,000, and a total decrease of 134, as compared with 1893. This decrease has taken place in the counties as distinct from the cities, there being an increase in the latter of 171. Subtracting Chatham, which has been added to the cities, in 1894 there was a total increase in cities of 40. As regards the districts in which the greatest decrease occurred, the county of Lambton shows a decrease of 110, and York 97. This latter decrease took place almost wholly in the City of Toronto, which shows a decrease of 95. Other cities showing a decrease are London, with 24, Kingston, 48, St. Catharines, 41, and Brantford, 8. On the other hand, Ottawa shows an increase of 218, Belleville, 60, Hamilton, 37, and Windsor, 50. The total marriages in Windsor were 551, or 51.7 per 1,000. This steady and abnormal increase in the number of marriages in Windsor is seen in the following table:

1890.....	47.7 per 1,000.	1893.....	47.5 per 1,000.
1891.....	48.2 “	1894....	51.7 “
1892.....	51.9 “		

The causes therefor have been referred to in previous reports, but its proximity to Detroit, a large city, famous for the number of its divorces, may play some part in the explanation.

With regard to the marriage rate, the general tendency toward a decrease is illustrated in the following tables of marriages during the past ten years:

Marriages in Ontario, 1884-1894.

1884.....	7.9	1890.....	6.6
1885.....	7.1	1891.....	6.7
1886.....	6.5	1892.....	6.7
1887.....	6.8	1893.....	6.6
1888.....	6.7	1894.....	6.5
1889.....	6.9		

A comparison in the number of marriages in Ontario with those of the New England States, with a population and climate so similar to Ontario, is given in the following table:

Marriage Rate in New England States in 1892.

Maine.....	8.63	Rhode Island.....	9.63
New Hampshire.....	10.64	Connecticut.....	8.32
Vermont.....	8.74	Ontario.....	6.5
Massachusetts.....	9.50	England.....	7.7

Means in 55 years in England..... 8.05 per 1,000.

The difference between the marriage rate in these States, compared with that in Ontario, is most notable. Reference has been made in past reports to the stationary character of our population as regards immigration, but in order to make a true comparison with, at any rate, Massachusetts, the influence on the marriage rate of the large number of young French Canadians employed in the mills of that State must be understood.

The following table shows what the increase of population in that State means:

Table showing proportion of Native to Foreign-born Persons Married in Massachusetts.

Year.	Native-born.	Foreign-born.
1884.....	62.76	37.24
1885.....	63.34	36.66
1886.....	62.65	37.35
1887.....	60.41	39.58
1888.....	59.70	40.30
1889.....	59.06	40.94
1890.....	58.11	41.89

There is, however, another most potent influence affecting the marriage rate in these States. This is the number of divorces as seen in the following table :

Table of the Divorces in New England States in 1892.

State.	Number.	Per cent. of total marriages.
Maine.....	552	9.2
Massachusetts.....	790	3.5
New Hampshire.....	347	8.5
Rhode Island.....	296	8.4
Vermont.....	167	5.7
Connecticut.....	501	7.6
Total.....	2,653	7.13

This in a population of 4,886,405 means .5 in every 1,000 or one divorce in every 18.54 marriages, or 5.8 per cent. of the total number of marriages. The rate per 1,000 of marriages in these States as corrected, after subtracting the divorces, would therefore be 8.74, since it is found that a very considerable percentage of divorced persons have married again.

Thus we see that in New Hampshire, Rhode Island and Connecticut there were in 1892 :

Number of divorces.....	1,144
Divorced persons who married again.....	623

This means 54.4 per cent. of all divorced persons have married again, and thus the comparison with Ontario can only be made after making this correction.

The total number of divorces in Ontario amounted in ten years to 22, or 2.2 per year, distributed as seen in the following table :

Divorces in Ontario, 1884-1894.

1884.....	1	1889.....	3
1885.....	4	1890.....	1
1886.....	1	1891.....	4
1887.....	2	1892.....	1
1888.....	2	1893.....	3

If a comparison of the three above States, giving the total number of divorced persons who have married again, be made with the total marriages in the same States, we find the following facts—1st, the rate of marriages is 9.59 per 1,000 ; 2nd, that the total divorces therein give a percentage of 8.16 of the total marriages ; 3rd, that 54.4 per cent. of divorced persons have married again during the year, or that for every 25 persons married in a year one person has been married twice.

It is evident that the marriage rate in these States, when their position as regards an old settled population is remembered, is manifestly abnormally high, and there can be no doubt that the readiness with which divorces can be obtained therein, is one chief reason why so many persons go to these States to be married.

It is of interest to notice in connection with the abnormally high marriage rate in these states, the relation thereof to the birth-rate.

Thus we have of births in 1892 :

New Hampshire.....	19.1 per 1,000
Rhode Island.....	24.5 " "
Connecticut.....	24.5 " "

The ratio between marriages and births in these States is thus :—9.59 marriages ; births, 22.7 or 1 to 2.36 ; while in Ontario we have 6.5 marriages, births, 19.2 ; or 1 to 2.95.

In other words, the birth-rate for all in Ontario is exactly 25 per cent. higher than the average of these three States.

Months.—The remarks made in recent reports with regard to the quarterly percentage of marriages celebrated, may again be repeated as regards 1894. The greatest number occurred in the quarter ending in December 31st. The quarter ending in June comes next, then the quarter ending in March, and the smallest number in the third quarter. December as usual has the highest number of marriages while May has the smallest, instead of August as in 1893.

Denominations.—The order of marriages by denominations shows no change from that in preceding years.

Deaths.

The total deaths for 1894 in Ontario as seen in table 1 of the report, were 22,538, being less than in 1893 by 365. This means on the basis of population adopted in this report, a death-rate of 10.3 per 1,000.

It is gratifying to note, that not only is the relative death-rate lower than in 1893, but that the absolute lives saved to the Province is 365. While remembering that the returns are still in some degree imperfect, it must be admitted that the results show a relatively high degree of healthfulness in the population of Ontario.

This is seen by the comparison made in the following table :

Tables.—33 large towns (England) 1894	18.1
London, 1894.....	17.8
Liverpool ".....	23.8
Birmingham ".....	18.2
Manchester ".....	20.4
Leeds ".....	17.9
Bradford ".....	17.0

In tables 3, 4, 5, will be found a recapitulation of the causes of deaths by classes.

Summarized for the whole Province, they are as follows :

Table showing Increase or Decrease of Deaths by Classes in Ontario.

Class of Disease.	1892.	1893.	1894.	I = Increase. D = Decrease.
Zymotic Diseases.....	4,670	4,116	4,629	I = 313
Constitutional Diseases.....	4,711	4,693	4,769	I = 76
Local ".....	8,211	8,394	7,978	D = 416
Developmental ".....	3,921	4,366	4,188	D = 178
Violent Deaths.....	845	769	783	I = 14
Cause not specified.....	762	565	391	D = 174
Total	23,120	22,903	22,538	D = 365

The table illustrates the fact of there being in 1894, an increase of the total contagious diseases in the Province, but that the number is still 241 below that of 1892. There is, moreover, a notable increase in the number of deaths falling under the group of "Local Diseases," and a decrease of nearly one-third in the class of "Cause not Specified." It is gratifying to notice that increasing precision of diagnosis, is characterizing the returns from physicians. This remark has been made in the several reports of the last several years.

Cities.—The deaths in the 13 cities of Ontario in 1894, show a decrease of 592 from that in 1893. Remembering that it is in the cities that the greatest increase of population occurs, that in cities there is the greatest number of births per 1,000, owing to a proportionately large number of persons at child-bearing ages, this decrease as an evidence of municipal sanitary improvement is most gratifying.

Table shewing Increase or Decrease of Deaths by Classes in Cities.

Class of Diseases.	1892.	1893.	1894.	I = Increase. D = Decrease.
Zymotic Diseases.....	1,580	1,453	1,274	D = 179
Constitutional Diseases	1,445	1,450	1,417	D = 33
Local ".....	2,578	2,702	2,375	D = 327
Developmental ".....	1,039	1,160	1,147	D = 13
Violent Deaths	205	196	192	D = 4
Cause not specified	103	81	45	D = 36
Total.....	6,950	7,042	6,450	D = 592

It is further gratifying to note what with a total increase of 313 from zymotic diseases in the Province, there is a decrease in cities amounting to 179.

By consulting the returns for the several cities in the general tables, those cities wherein the falling off occurred will be seen to be Toronto with 278 less, London 33, Kingston 6, St. Thomas 8, Belleville 18, and Windsor 13.

Tuberculosis.—The total deaths from tuberculosis have decreased slightly from 1.8 in 1893 to 1.58 per 1,000 in 1894.

The several centres of prevalence in our city group still show their relatively high rate; but in several cities it is probable that the existence of general hospitals in these centres adds something to their actual rate owing to persons resident elsewhere dying in them. The illustrations of the relative prevalence of this disease in different geographical areas of the Province, as set forth in the report for 1893, may be seen by examination of the several tables to have been maintained in 1894.

Diphtheria and Croup.—The total deaths in the Province from this disease in 1894, were 1,075, or 133 more than in 1893. While practically the same rate, if we allow for the increase in population, the total rate per 1,000 is only .49 for 1894. This is higher than in England, which had in 1893 only .32 per 1,000, but lower than Massachusetts, which had in 1893 .57 per 1,000.

The falling off seen in cities of deaths from tuberculosis is similarly seen in the deaths from diphtheria. Thus there were in 1892, 513 deaths; in 1893, 418 deaths, and in 1894, 380 deaths. This showing is very remarkable and illustrates the steady growth of the public health measures of isolation and disinfection. If from the list the city of Ottawa with a total of 124 be excluded, the death-rate from this disease in 12 cities would be only 0.6 per 1,000, in a population of 379,628 in our cities.

While higher than in Great Britain, it is still gratifying to know that it means an almost uninterrupted decrease in the deaths from this disease in the cities of Ontario.

Deaths from Diphtheria and Croup, European Cities, 1893.

Berlin92
Rome27
Vienna	1.14
New York	1.05
Liverpool12
Birmingham13

Typhoid Fever.—It is satisfactory to know that deaths from this disease have almost steadily decreased during recent years. There can be no doubt that in addition to the improved sanitation of our rural districts, this must be directly traced to the yearly increasing number of towns and cities, establishing public water works.

We have now in Ontario public water supplies established as follows :

Total cities in Ontario.....	13	Public water supplies.....	13
“ town and villages.....	110	“ “ “	62
Sewerage systems, in cities		“ “ “	12
“ “ towns and villages “		“ “ “	20

Scarlatina (Scarlet Fever).—This disease, which as before mentioned, has been present only in a limited degree during the last ten years, had, as remarked in last year's report, begun to show a renewed activity. There have been 454 deaths in 1894 or .21 per 1,000. Relatively it is lower than Massachusetts, which had 810 in 1893, or .33 per 1,000.

This disease, owing to some cause, does not tend to have the same mortality on this continent that it has in England. Thus :

Scarlet Fever in England, 1893.

Number of Deaths.	Ratio to 1,000 of Population.
6,98223
Mean ten years, 1882 to 189226
London37

Influenza.—The recrudescence of this disease in 1890 and in 1892, in all parts of the world, again shows in 1894, an increase over the previous year.

The deaths from it in Ontario since 1892 are :

1892	927
1893	483
1894	613

Its characteristics as a disease, especially affecting the innervation of the heart, have been remarked upon by all practising physicians, and hence its serious influence on the death-rate is especially seen in the increase of deaths notably in adult life. Being therefore in its immediate effects, a disease of the nerve centres, we must unfortunately expect to find it persist so long as its distinctly infectious character is not fully recognized, adding very materially to the annual mortality where diseases of the nervous system are increasing, owing to the high pressure rate of living, as seen in our cities, being maintained.

Amendments to the Act

The following extract from the Report for 1893, corrected for 1894, may properly conclude this report :

"The study which has been made in the preceding pages of the various returns for births, marriages and deaths again brings into prominence certain defects in the matter of complete returns, which have been specially referred to in the annual report for several past years. The remedies which have been deemed desirable for some of these defects have likewise been pointed out, and the urgent necessity for them makes itself daily manifest in the imperfect results of searches in the records for births, or deaths occurring in years past, and upon the evidence of which the material interests of many persons often depend.

"Thus there were issued in the past four years the following number of certificates :

	1892.	1893.	1894.	1895.
Births	85	98	103	133
Marriages	38	46	48	69
Deaths	148	200	183	163
	371	344	334	365

"In addition to those applications for which certificates were issued from letters on file requesting that search be made and certificates issued, there were 127 letters in 1894, and in 1895, 138 ; but a very considerable addition to this must be made of applications made personally, by telephone from legal firms in Toronto, and occasionally by telegrams in urgent law cases.

"While the unsuccessful searches in a good number of instances are for records of births, marriages and deaths, which occurred before the Registration Act came into force, yet many were applications for certificates within this period (1869) which could not be granted in the absence of any record. Taking all together probably not much less than 1,000 applications were made in 1895, and with years the demand will become greater as more questions of heirship to property arise.

"In the report of the Inspector, Col. R. B. Hamilton, included in this report, the condition of the returns is commented upon, and he has again pointed out the direction in which improvements in registration are demanded and has presented recommendations with a view to this end. Summing up the recommendations made in previous reports, they include principally :

"1. Certain amendments by which the duties of division registrars, under certain conditions, are made more plain.

"2. A clause to prevent burials by undertakers or others without certificates of a medical health officer, or a coroner.

"3. The supplying of an index book for the use of division registrars, whereby a local record of births, marriages and deaths may be kept.

"4. The increase of the fee for registration to an amount sufficient to recompense the division registrar for obtaining complete records of births, marriages and deaths.

"Other minor improvements might with advantage be made, notably that by which the division registrars cannot be deprived of their fees, by any prior agreement for commuting the amount of any fees which they would receive for services performed under the provisions of the Act relating to births, marriages and deaths.

"Trusting that these recommendations, the need for which becomes, year by year, more urgent, if completeness of returns is to be approximated, may receive your early consideration.

"I have the honor to be,

"Your obedient servant,

"PETER H. BRYCE,

"Deputy Registrar-General."

REPORT OF THE INSPECTOR.

TORONTO, January 2nd, 1896.

TO THE HON. RICHARD HARCOURT,
Registrar-General of Ontario.

SIR,—I have the honor to report that during the past year I visited, for purposes of inspection, 107 division registrars within the following counties, viz. :—

Algoma,	Grey,	Middlesex,	Prescott and Russell,
Carleton,	Hastings,	Muskoka,	Simcoe,
Dufferin,	Lanark,	Northumberland	Victoria,
Elgin,	Leeds and Grenville,	and Durham,	Waterloo,
Essex,	Lennox and Addington,	Ontario,	Welland,
Frontenac,	Lincoln,	Peterboro',	York.

I find that with very few exceptions none of these officials keep a duplicate copy of the returns of births, marriages and deaths sent to this office, but they are almost unanimous in the opinion that it would be much more satisfactory if a book were provided for that purpose. As this question has been brought before the Legislature, I deemed it my duty to get an opinion on the subject, from as many division registrars as possible, and I find that although a few take very strong ground against being compelled to do "extra work," the large majority consider it would be an advantage to the municipality, if a copy of the returns could be seen within their own borders.

I certainly consider it is of vital importance that a book should be kept for each division registrar, but I would not recommend the adoption of this, unless at the same time the fee for registration be increased. This latter is of absolute necessity, if it is desired that anything like correct returns be made. As I have before pointed out, the present fee is ridiculously small and it cannot be expected that any good results can be obtained so long as the officials can justly complain that they are so inadequately paid.

I have now visited all sections of the Province, and find that the difficulties of securing full returns are much the same in the several localities. These difficulties have been fully dealt with in previous reports, so it is unnecessary to repeat them here, but I will briefly summarize what I consider the best means to be adopted to make the returns at all reliable, in the hope that the Department will take up the matter during the coming session.

- (1) The fee for registration should be increased.
- (2) The amount due each division registrar by a municipality, as shown by certificate from the Registrar-General, should be a lien upon said municipality until paid, and no mutual agreement for commutation should be considered legally binding upon the division registrar.
- (3) No certificate for payment of these fees should be issued by the Registrar-General until he is satisfied that every return has been made as complete as under the circumstances may be possible.
- (4) Each division registrar should be supplied with properly ruled books, in which to keep duplicate entry of each birth, marriage or death received by him.
- (5) The duties and powers of division registrars should be more clearly laid down than they are at present.
- (6) Prosecutions should be made by the Department. The division registrar should be relieved from this duty, but be compelled to send names of delinquents to the Inspector.

(7) The medical profession should be given clearly to understand that there are certain duties in connection with the Registration Act which they are called upon to perform.

(8) Steps should be taken by means of notices in the local papers, posters, etc., to let citizens know that several changes have been made in the Registration Act, and that all the provisions of the said Act are going to be strictly carried out. Probably the most effective way of doing this would be to institute a series of prosecutions in different sections of the Province.

In considering changes in, or amendments to the Registration Act, there are many other matters of detail, some of which have been pointed out in previous reports, which will come up for consideration, but in this report I have endeavored to summarize as briefly as possible what I consider absolutely necessary to be done if the returns of births, marriages and deaths are to be considered of any importance whatever.

For many years the provisions of the Act have been defective. I trust that during the coming session improvements will be made by which it will become of much greater value to the Province.

I have the honor to be, Sir,

Your obedient servant,

R. B. HAMILTON,

Inspector.

TABLE 1.

Table showing the total number of Births, Marriages and Deaths in each County in 1894.

Counties.	Population.	Births.			Marriages.			Deaths.			Totals.			Ratio to 1,000 of the population.
